3. the goal is to minimize a linear function of the variables: $c^T x = c_1 x_1 + \dots + c_n x_n$. If x satisfies the constraints ($Ax = b$, $x \geq 0$) then we call x a feasible solution to the canonical Linear Programming problem; if further x minimizes the linear function $c^T x$, then x is called an optimal solution to the canonical Linear Programming problem.

Introduction Generalized Linear Models Structure For example, a common remedy for the variance increasing with the mean is to apply the log transform, e.g. $\log(y_i) = \beta_0 + \beta_1 x_i + \epsilon_i$ $E(\log Y_i) = \beta_0 + \beta_1 x_i$ This is a linear model for the mean of $\log Y$ which may not always be appropriate. E.g. if Y is income perhaps we are really interested
