In probability theory, the central limit theorem (CLT) establishes that, in some situations, when independent random variables are added, their properly normalized sum tends toward a normal distribution (informally a "bell curve") even if the original variables themselves are not normally distributed. The theorem is a key concept in probability theory because it implies that probabilistic and ...

In number theory, the prime number theorem (PNT) describes the asymptotic distribution of the prime numbers among the positive integers. It formalizes the intuitive idea that primes become less common as they become larger by precisely quantifying the rate at which this occurs.

Box and Cox (1964) developed the transformation. Estimation of any Box-Cox parameters is by maximum likelihood. Box and Cox (1964) offered an example in which the data had the form of survival times but the underlying biological structure was of hazard rates, and the transformation identified this.

while  $\lim_{h \rightarrow 0} \frac{1}{h} \int_{x-h}^x f(t) dt = f(x)$ . Hence, the long-run generalized impulse responses in levels depend on the long-run impact matrix  $C$  and converge to a finite matrix, while the long-run generalized responses for the cointegration relations converge to zero.
