In analytic geometry, an asymptote (/ ˈæː ˈsɪː ˈmpt ˈoʊt /) of a curve is a line such that the distance between the curve and the line approaches zero as one or both of the x or y coordinates tends to infinity. Some sources include the requirement that the curve may not cross the line infinitely often, but this is unusual for modern authors. In projective geometry and related contexts, an ...

asymptotic control may not result. As an example for case (i), consider the Bonferroni method. If the p-values were perfectly dependent, then the cut-off value could be changed from  $\alpha$

Box and Cox (1964) developed the transformation. Estimation of any Box-Cox parameters is by maximum likelihood. Box and Cox (1964) offered an example in which the data had the form of survival times but the underlying biological structure was of hazard rates, and the transformation identified this.
