Metabolic network reconstruction and simulation allows for an in-depth insight into the molecular mechanisms of a particular organism. In particular, these models correlate the genome with molecular physiology. A reconstruction breaks down metabolic pathways (such as glycolysis and the citric acid cycle) into their respective reactions and enzymes, and analyzes them within the perspective of ...

Genomic studies have established four major breast cancer intrinsic subtypes (luminal A, Luminal B, HER2-enriched, basal-like) and a normal breast-like group that show significant differences in incidence, survival and response to therapy [1 â€“ 3].However, as gene expression studies evolve, further subclassification of breast tumors into new molecular entities is expected to occur.
