The principle of a difference engine is Newton's method of divided differences. If the initial value of a polynomial (and of its finite differences) is calculated by some means for some value of X , the difference engine can calculate any number of nearby values, using the method generally known as the method of finite differences. For example, consider the quadratic polynomial

A finite difference is a mathematical expression of the form $f(x + b) - f(x + a)$. If a finite difference is divided by $b - a$, one gets a difference quotient. The approximation of derivatives by finite differences plays a central role in finite difference methods for the numerical solution of differential equations, especially boundary value problems.

Methods of Comparing Images Compare Program The "compare" program is provided to give you an easy way to compare two similar images, to determine just how 'different' the images are. For example here I have two frames of a animated 'bag', which I then gave to "compare" to highlight the areas where it changed.
