Strong ground motion measuring and recording instruments play a major role in mitigation of seismic risk. The strong ground motion near the source of an earthquake describes the effects that endanger our built environment, and is also the most detailed clue concerning the source mechanism of the earthquake.

The relationship between size of the strong motion generation area and seismic moment is shown in Fig. 2. This seismic

Vertical component of strong ground motion is mainly associated with body-waves: vertically propagating compressional (P-wave) and horizontally propagating dilatational (S-wave) waves. Compared to horizontal component, vertical motion may be richer in high frequency content in the near-field of an earthquake fault.
