Definition. Two versions of the definition of a divisor are commonplace: If  $a$  and  $b$  are integers, and more generally, elements of an integral domain, it is said that  $a$  divides  $b$ , or  $a$  is a divisor of  $b$ , or  $b$  is a multiple of  $a$ , and this is written as  $a \mid b$ , if there exists an integer  $c$ , or an element of the integral domain, such that  $b = ac$ . Under this definition, the statement  $a \mid b$  holds for every  $b$ .

Euclidean division of polynomials is very similar to Euclidean division of integers and leads to polynomial remainders. Its existence is based on the following theorem: Given two univariate polynomials  $a(x)$  and  $b(x)$  (with  $b(x)$  not the zero polynomial) defined over a field (in particular, the reals or complex numbers), there exist two polynomials  $q(x)$  (the quotient) and  $r(x)$  (the remainder ...

Some of the numbers in the table have simple explanations: Two numbers are called relatively prime when there is no number exceeding 1 which divides them both. If  $f$  is the greatest squarefree number which divides the product of all members of a generalized aliquot cycle, then multiplying each member of the cycle by  $f$  will change a modified exponential aliquot cycle to an exponential aliquot cycle.
